

Discussion

Presentation

As part of my discussion, I conducted a presentation that I presented to my peers. It contained information about the current system, and also the aims of the new system I have proposed to the business. The presentation will be attached to the rest of my work handed in for you to watch.

Feedback

To: Tom Tanner

Hi tom

thanks for doing your presentation in front of the class.
Here is a summary of the feedback given by the class.

They thought your intended system would be useful to the club but thought it may need the following functions:

- recording what players are in individual teams
- recording and checking up on what players have paid their subs (payments)
- Producing lists of teams
- Producing list of different playing positions (e.g. gk's for when they run specific training)
- Finding contact details for a specific player
- Saving details of any medical issues/needs (e.g. asthma)

One student mentioned that you might want to include a stock control system for balls, cones etc, so the club don't run out

hope this helps

Mr M Dulake
DoEL

After I presented my show to the class, I received an email from my Teacher that contained feedback from both him and my classmates about my proposed system idea.

Here are the responses I have given to my classmates:

1. Could you record what players are in what individual teams?

Yes, I am planning to include a field in the Players data where the user can select the Age Group that the player falls under. I can see why you think this would be a good idea, as it can come in handy when searching for specific players, or indeed specific teams.

2. How are you going to record and check which players have paid their subs?

My system is going to include a form where the user can select an Age Group, which will then display all the players from that age group, along with the amount they have paid, and then how much they have left to pay. This form will also include the option to make a payment for a player.

3. Will your system be able to produce a list of all the teams?

The system will definitely feature a form which will allow the user to select an Age Group, and then the names of every player in that team will be listed. This is vital because the staff members would need to know which players to contact with information about that certain team's fixtures or events.

4. Will your system be able to produce a list of all players from a certain position?

The system will have a feature in which the user can select a position, and it will then display every player who plays for the club in that position, across all age groups. This is a good feature to have, because training sessions are often organized which focus on specific positions.

5. Will you be able to find contact details for a specific player within the system?

Yes, there will be a form in the system where the user can input the name of a player, and then the form outputs their parent's name, email address and phone number. This is vital as coaches or staff members may need to quickly contact a parent if their child has had an accident or an injury.

6. Will your system store medical information for specific players?

This would be a good idea for the system, but I don't think it is vital, as this information only really matters to the parents of the players and their coaches.

7. I believe it would be a good idea for you to store a stock system for balls, cones etc. Will you do this?

After listening to your feedback, I think I will go and include a stock feature in my system, as I previously didn't think of this as an idea, but I really like the sound of it. I would need to allow the user to enter an item, the quantity of it in stock, and then any extra information needed, and I would also need to implement a function that allows the user to change this quantity.
